

Nagios XI - Ajaxterm Installation Aborted

Article Number: 158 | Rating: 1/5 from 1 votes | Last Updated: Mon, Feb 22, 2016 at 7:29 PM

Problem Description

Nagios XI 2012 and late versions of 2011 set up apache to be able to utilize the Ajaxterm subcomponent.

This component requires a modification to the `/etc/httpd/conf.d/ssl.conf` file, and adds some proxy information needed specifically for ajaxterm.

If apache failed to restart after making these modifications, the previous configuration gets rolled back in order to keep apache running the the system usable.

Resolving The Problem

The bad configuration that the fullinstall/upgrade script attempted to apply is saved to `/etc/httpd/conf.d/ajaxterm.fail`.

This file can be debugged and once fixed, can replace the existing `ssl.conf` file in order to utilize Ajaxterm.

Note: Remove the `/etc/httpd/conf.d/ajaxterm.fail` file once the issue is resolved to avoid the error message in the UI.

Final Thoughts
