

Web Browser Reports 330 Error Content Encoding

Article Number: 567 | Rating: Unrated | Last Updated: Tue, Dec 18, 2018 at 5:44 PM

Problem Description

In rare circumstances you may come across the following error in your web browser when accessing one of the Nagios products:

```
Content Encoding Error
```

```
The page you are trying to view cannot be shown because it uses an invalid or unsupported form of compression.
```

```
* Please contact the website owners to inform them of this problem.
```

```
Error 330 (net::ERR_CONTENT_DECODING_FAILED): Unknown error.
```

Resolution

The Apache web server requires `zlib.output_compression` to be configured to `On` in the `/etc/php.ini` file.

Execute the following command to open the file in vi:

```
vi /etc/php.ini
```

When using the vi editor, to make changes press `i` on the keyboard first to enter insert mode. Press `Esc` to exit insert mode.

To locate the line `zlib.output_compression =` type the following:

```
/output_compression =
```

This should take you directly to the line. Change the setting to `On`:

```
zlib.output_compression = On
```

When you have finished, save the changes in vi by typing:

```
:wq
```

and press **Enter**.

The last step is to restart the Apache service using one of the commands below:

RHEL 6 | CentOS 6 | Oracle Linux 6

```
service httpd restart
```

RHEL 7 | CentOS 7 | Oracle Linux 7

```
systemctl restart httpd.service
```

Ubuntu 14

```
service apache2 restart
```

Debian | Ubuntu 16/18

```
systemctl restart apache2.service
```

After the service has restarted the problem should no longer occur.

Final Thoughts
